

“Faced with today’s food and energy crisis, how can society improve its well-being?”

My idea about this question came to me when I realized how expensive a university education is. I am 19 years old and searching for a university abroad at the moment.

I think the energy and the food crisis have two angles, angle one is that the well developed countries needs less developed countries and in that manner spend less energy. Angel two is that the less developed countries needs to become better developed and in that matter is able to produce more food.

My opinion is that angel two is the one which are better in the long run. And that is a very important part of my idea, the long run. We cannot see things for what they are today; we have to see things for what they will be in the future. I think that the main part when a country needs to be better developed is that the education system works, every single boy and girl on our planet needs education. As I said earlier it is very expensive to attend a school/university in Europe, that’s because the school has a lot of expensive, they have to pay rent, taxes, teachers and so on. I therefore want to start a university in a less developed country, let us say Kenya in Africa. If a build a school in Kenya the costs becomes much lower because the costs of building, they rent and the taxes are much lower, the students will in that manner get a cheaper education. Students from Europe and the rest of the world will therefore attend the school. The school will be spent money in Kenya and this will give people jobs to companies, the state and people. I will also make sure that the rent which is paid to Kenya’s state will be used in a manner which is good to the people, to build new schools or provide their infra structure. Building a school in Kenya will give me a cheaper deal then for example building a school in England. This will as well include that one hundred students at my university have to be from Kenya. The rest of the students are welcome no matter which country around the world they are from, and it will be a cheaper deal then their home country has, so I am quite sure that there will be a lot of interested students.

This will give the less developed country more educated citizens and they will also get well educated people from around the world. This will also give the less developed country money which they have to spend on things that makes their country better developed. My school and the teachers will be experts on the food and the energy crisis around the world. There will be a lot of research about this and that is what we are particularly known for around the world, every student who wants to be educated in the food and the energy crisis will attend my school and in the same way make this country better developed. There will of course also be other educations so that there is something that fits everyone. I want these schools to have about one thousand students each and my dream is that my schools will be in every country which has a food crisis or in another way need to be better developed.

As I said this in built up with a very long perspective and I am aware that this in the short run will mean a lot of transportation which in the short run is nor good according to the energy crisis, but if we see this in the long run I think this is an excellent project. In the long run this will give the countries better economies which they according to the rules have to spend on certain things which develop their country. In the long run this also will give these countries citizens an education they maybe never have the

opportunity to get otherwise. It will also give students from around the world an opportunity to attend an education they could not afford if it had been in Europe or North America. These students will discover a new country and maybe they stay to live in this country and in that manner helps this country get even more developed. This will also give students from the particular country and students around the world a very good education about the food and the energy crisis. Better economy and well educated people in the country will in the long run end up with good opportunities to produce more food for the people. If a country has better educated people they will make jobs for even more people in the country, jobs means money and money means food.

I do not think that people without food or money are able to care about the energy crisis enough, and even if they care enough they cannot do that much as they could if they had food and money, because if have food and money they can be able to do research about the energy crises. My schools around the world will as I said work with research and educate students about the energy crisis. The main idea of these researches will be to find an alternative fuel so that we do not need oil and gas on our planet. If I can start a school with people from around the world including people from the particular country, we have created the best platform for research and education about alternative fuel. My wish is that these schools will be available in every country with a food crisis; my wish is also that a couple of companies around the world will understand the huge opportunity with these schools and universities.

Summary:

Starting a university in a country with a food crisis will entice people from around the world because they get a cheap education; the university will also educate native students. The students will help the country to build up their economy and educate its citizens. Money and educated people will solve the food crisis in the particular country. The students at these schools in less developed countries will study and do research about the energy and the food crisis, Particulate to find an alternative fuel. Money the university generates has to be spent to minimize the food and energy crisis.
