Summary:

The energy crisis and the food crisis are two contemporan problems with what humans need to face in an important moment of their evoloution.

The energy crisis has very strong bounds with the food crisis, because once the biodiesel carburant has been discovered and wich is made out of rape, this fenomenon of cultureising the rape at a global scale, less cereals were planted, plants that are necessary breeding the animals, that constitue the main part of our food.

Theese two problems will be fixed with the help of scientific persons, mass-media, gouvernemental institutes, and teachers wich will teach children in schools how to combate theese problems, the children being our tomorrow's future.

Essay:

The energy crisis became not long ago a very controversed subject of today's society, but existing for a very long time and not being taken in serious, nobody saying anything, being a silent problem in the way that nobody wasn't doing anything, until she got so severe that today she affects all human kind. Theese effects can be seen by: expencive carburants, electricity, and all things that depend on energy in the life of every man.

Few people are aware that the necessary resources through wich the benefits spoken above without wich a human's existence would be roughened are about to be epuised. When this critical point will be reached the human kind will have to make an 180 degrees switch, in the sense that we will have to go through a transition process wich will be represented by switching to alternative energy sources and wich will not be easy to adapt or put into practice.

Food has been, is and will be one of the most important elements in the life of every man with air and water, without who, a man couldn't survive. We can say that the food crisis has very strong bounds with the energy crisis, theese two being contemporan.

We can say that as a secondary effect of the energy crisis is the food crisis.

The food crisis is in great part owed to the energy crisis because once the biodiesel carburant was discovered and wich is made out of rape this fenomenon of cultureising the rape gaining terrain at a global scale, less cereals were planted, plants wich are necessary breeding the animals that constitue the main source of our food, this way getting to an excessive price raseing of aliments that few can afford.

Because of the energy crisis the human kind is going through a transition process that can help us not being too much dependent on the natural resources such as oil or natural gazes.

In this so called 'transition process' man desvolted himself a series of possibilities that can help him ameliorate for the moment the energy crisis and in a particular moment of its evolution, stopping it.

Some of these possibilities are: solar energy, wind energy, hydrologic energy, geothermal energy.

The first three possibilities are considered pure energy sources in the sense that they don't affect very much the surrounding environment;but the last one being difficult realizing it and also being harmful to the surrounding environment, because once the steems being brought to the surface, also are brought gas noxes that are nocive to the atmosphere on Terra.

This transition can gain terrain only with the help of the leading legal organs of every country that can eliberate laws in this way.

For the beginning , putting away the energy crisis,because a man without food can not survive a series of agreements are needed to be taken immediately in the sector of agriculture.

Because of the very dry seasons of the last years that were been favourized by the global warming ,another conroversed subject of our times ,the food crisis , the agriculture has been suffering.

So, the first thing that every country needs to desvolte in the agriculture is the irrigational system.

Than, after this part has been fulfilled , another problem intervines in the rows of agriculturers , money, the necessary money to be able to plant the fields.

In the fixing of this problem, again the leading organs need to intervine ,and set a program of subventions for the agriculturers expences such as: carburants that are necessary for the functioning of the machines, or seeds on what wich the plant culture is realized .

This way the food crisis being partially ameliorated we can speak again about the energy crisis.

Around the world different states and countries are putting in practice renewable energy sources.

Some of these are: Hawaii, with 5-12 million gallons of biodiesel supply 110 megawatt of electricity and 4,000 solar water heaters are installed every year.

New Zealand Commits to 90% Renewable Electricity by 2025 already uses 70% renewable electricity also increase in forest area of 250,000 hectares (617,000 acres) by 2020.

Theese examples are making a difference in the way that humans are on the right path of switching from natural energy sources to alternative energy sources.

It will take a time until this fenomenon will reach a fully global scale, in the way that in a few years a majority of citizens of each country will have its own partial alternative energy sources.

Also children need to be teached at school how to become fond of animals, because few people like today to breed animals, or even having a pet in the house.

Anyway, those who will make a difference alongside teachers, mass-media, gouvernemental institutes and science people will be the children, because they will be our tomorrow's future.
