

"Faced with a food and energy crisis, how can society improve its well-being?"

Flipping through the various spectrums of our society all these years, we have become well acquainted with the negative folds we are living in. Scrutinizing the interior most puzzle we can visualize the scrambling of the whole system stature and how it is unfolding the common myriad in front of this mammoth piece of crisis which is enveloped with negative clouds along with various detailed queries existing. Without delegating the responsibilities to other people's shoulder, we should slip into the shoes of firstly walking into the coat of controlling rapid population growth, understanding the practical portrait of our society, individuals should restrict birth giving to only one. Over the years this stature has been discussed for the forthcoming hurdles and accordingly now it's the time to act upon it. The rapid population growth is 85% responsible for the crisis enveloping our society and accordingly the foundation needs to be straightened. Followed up is a very neat solution to the basic problems of food crisis where the inhabitants needs to maintain a very clean atmosphere in terms of not polluting the cultivation land as well as the air we are inhaling every second. Every child in his childhood classes are made aware of the topic 'pollution', so that when they grow up they are intended to imbibe the lessons in their day to day life, whether it's the industrial remains, residential usage, personal garbage or agricultural substitutes. The cause should be checked by our own means by not allowing the remains of the industrial usage to be filtered out in the agricultural plot, not using polythene as a daily baggage in personal uses and getting rid of it by shrugging them in the land around us. How come the notion of deplanting and deforestation knock the brains of the myriad? When they are pretty well acquainted of the fact that the deforestation act will inturn delocate them from their living in this society, will give birth to the climate destortion, will count on the accumulation of the inevitable term Global Warming, and specifically will deploy them with proper supply of food and energy connectively. The solution is very pellucid, that the act of avoiding deforestation and inreturn planting of more trees needs to be pounced upon by us and the political bodies respectively as it's a team effort (as said in industrial background). Every individual is firm on the fact that the immense flip in weather in this current era is primarily due to the reduced rainfall in respective places, because of more of heat enveloping the land than required, adding up of the ozone layer leading to increase in global warming threat. Precisely when the aftermath of such consequences are generalized with the common people then why is it that the steps taken are very meager? Until and unless effort is implemented by the common myriad the change for a sustainable society will remain a fable. Simultaneously, pondering over the usage of coal has been in practice before 20th century and since then the reduction level has ignited owing to the multiplied demand of energy as in petroleum or gas. Scrutinizing every mass usage of energy the reproduction of the energy used is lying void apparently. The very well known fact is the gulf countries have over the years been an expert for petroleum or oil production; contradictorily the reproduction process needs a fuel to maintain the petroleum production level which would suffice the increasing demands of the myriad on an industrial stature as well as personal requirements. The concept of solar energy and equally solar thermal energy with semi conductor cells spreaded wide to generate electricity is still holding on to the progress rope. Along with the mentioned paths to stuff in energy the light of scarcity eventually drops on water level reducing with every individual being added to this mammoth stage of human race. Eventually the production of hydroelectricity with water as its parent source is diminishing in the increasing demand of livelihood; contradictorily, the scarcity has not been yet structured enough to blink upon the thought of preserving the essentials for the contemporary situation as well as the upcoming lives. The battery operated cars and two wheelers

have been initialized quite adequately but it seems that the myriad needs to be impelled by rules regulating the usage of such alternatives to preserve petroleum. Very surprisingly the price rates of petroleum has always shot up the cost charts and seriously affected the middle class and the lower society livelihood though transmitting zero positivity in the less usage of petroleum. Other forms of gases are being generated for the same but the question for the utilizing of such inventions remain synonymous. In this murky era isolated from the mentioned known facts of preserving food and energy for maintenance the virtual representation between the populace and the bureaucratic society needs to be apprehended very effectively. The sustainability of the human race is no more balancing on the primitive term "Survival of the Fittest"; as now it's the commonality who requires to inbibe an exertion in maintaining the sources for the survival. Consummation of the whole notion discussed, flags up one momentous remedy; the change for survival is on, it's the common race who ought to stimulate every possible explication for receiving a sustainable ambiance.

Summary :

With the onset of various remedies related to the preservation of our natural sources of food and energy inclusive of the usage of thermal power plants for production of electricity, secluding the cultivating lands from the disasters of pollution created by the increasing human race and primarily allowing the populace to understand the risk of immense rapid growth of population which needs to be planned out with every individual, as it's the common people who in return extinguishes the source of production of essentials owing to their requirements. For a society enveloped with secure amount of food and energy a structured pattern needs to be implemented mutually by the human race and the political society. Pressurizing the citizens of a lower band due to scarcity of essentials is not the solution, this hurdle is of a global stature and the maintenance of such issues requires effective participation of everybody and remarkable result too. Distinguishing each other on a political level is a prime NO for such issues, Common people can understand the need to perform but the masters to implement this need are the respective political families. Mutual correspondence and unbiased response from government houses are expected. Every strategy ought to be implemented by the populace along with the political groups rather than just faking out ideas and views whereas the common awaiting for the real change to happen for them, for their upcoming families. Its dialogued by an unknown – "You cannot plough a field by turning it over in your mind" describes the explanation to the contemporary dilemma.
